Description

The **CubeGrid** is an interactive grid component that presents very large, multi-dimensional data sets (also known as *data cubes*) for reporting or analytic applications.

CubeGrids are often called *crosstabs*, for their cross-tabular display of data dimensions in stacked/nested rows and columns, or *pivot tables*, for their ability to “pivot” dimensions between rows and columns to view a data cube from different perspectives. They are typically used in the querying and reporting front-ends of data warehousing, decision support, OLAP, and business intelligence systems.

Multi-Dimensional Data Terminology

This manual refers to the dimensions of a data cube as **facets**, to the possible values in each facet as **facet values**, and to the values within the data cube as **data values** or **cell values**. Equivalent terms that are commonly used in data warehousing or business intelligence systems include:

<i>facet</i>	<i>dimension,</i> <i>attribute,</i> <i>feature</i>
<i>facet value</i>	<i>dimension member</i> <i>attribute value,</i> <i>feature value</i>
<i>cell value</i>	<i>data value,</i> <i>metric value,</i> <i>measure</i>

Visual Structure

Like the ListGrid and TreeGrid components, the CubeGrid displays data values in a tabular *body* with adjacent *headers*. While the ListGrid and TreeGrid display rows of *records* with *field values*, the CubeGrid displays a body of individual *cell values*, each associated with a combination of *facet values*. The facet values for a cell are displayed in the *column headers* above the cell and *row headers* to the left of the cell. CubeGrids can display an arbitrary number of facets, by stacking multiple levels of row and/or column headers.

The CubeGrid depicted below displays five facets of a data cube. Region and Product are presented as *row facets*, with facet values displayed in two columns of *row headers* to the left of the body. Quarter, Month, and Metric are presented as *column facets*, with facet values displayed in three stacked rows of *column headers* above the body.

		Column Headers (facet values)					
		Quarter		Q1, 2002			
		Month		January		February	
						March	
Region	Product	Revenue		Profit		Revenue	
		Profit		Revenue		Profit	
Western U.S.	Office Chairs	\$50k	\$5k	\$42k	\$4k	\$25k	\$2k
	Pens	\$10k	\$2k	\$12k	\$4k	\$18k	\$9k
	LCD Monitors	\$120k	\$44k	\$160k	\$68k	\$220k	\$112k
Midwest U.S.	Office Chairs	\$22k	\$2k	\$12k	\$1k	\$6k	\$1k
	Pens	\$8k	\$2k	\$10k	\$3k	\$7k	\$2k
	LCD Monitors	\$20k	\$5k	\$75k	\$32k	\$135k	\$66k
Eastern U.S.	Office Chairs	\$40k	\$4k	\$35k	\$4k	\$15k	\$2k
	Pens	\$22k	\$4k	\$31k	\$8k	\$44k	\$20k
	LCD Monitors	\$105k	\$25k	\$164k	\$88k	\$190k	\$115k
		Body (cell values)					

Except for the innermost column facet, each facet in a CubeGrid has a *facet label* adjacent to its row or column headers. The facet labels serve two main purposes: they display the titles of the facets, and they provide drag-and-drop reordering or pivoting of facets within the . The *row facet labels* also provide interactive selection, resizing, and other operations on the columns of row facet values.

The *innermost column headers* provide special behaviors and controls for manipulating the columns of data in a CubeGrid. End users may select, resize, reorder, minimize, maximize, or auto-fit the columns of data via mouse interactions with these headers. Customizable indicators and controls may be included at the top of each innermost column header. The CubeGrid in Figure 1.1 shows the column reorder and column minimize controls.

If a CubeGrid is not large enough to display all of its cell values, horizontal and/or vertical scrollbars will appear below and to the right of the body. The body of the CubeGrid may be scrolled on either axis. The headers are “frozen” from scrolling on one axis—row headers only scroll vertically, while column headers only scroll horizontally—so the facet values for the visible cells are always displayed.

CubeGrid Examples

Two detailed CubeGrid examples are provided in this release:

- `examples/components/cubeGrid_chart_example.html`
- `examples/analytics/databound_cubegrid.jsp`

`cubeGrid_chart_example` is a client-only example that uses a small local data set to demonstrate:

- basic facet and facet value (metadata) definition
- facet layout
- grid layout and formatting (alignments, borders, widths)
- interactive grid layout (resize/reorder/minimize columns)
- interactive hover windows
- cell highlighting (interactive and programmatic)
- context menus (default and customized)
- cell selection (interactive and programmatic)
- cell formatters
- shared data (with a ListGrid)

`databound_cubegrid` is a client/server example, requiring installation of the ISC server components. This example binds a cubeGrid to a live datasource with approximately 50,000 data values, to demonstrate:

- hierarchical facets
- automatic query building
- load on demand
- incremental rendering
- facet value expand/collapse
- facet value minimize/maximize
- basic inline cell editing
- interactive facet layout (drag & drop pivoting, menu-based filters)

Client API Summary

The following pages provide a complete quick reference to the CubeGrid client-side APIs.

These APIs are grouped into the following functional categories:

<i>Data & Metadata</i>	<i>Mouse Events</i>
<i>Facet Layout</i>	<i>Inline Editing</i>
<i>Facet Expansion</i>	<i>Hover Tips</i>
<i>Grid Layout</i>	<i>Context Menus</i>
<i>Grid Formatting</i>	<i>Column Controls</i>
<i>Highlighting</i>	<i>Advanced/Internal</i>
<i>Selection</i>	

CubeGrid instances provide most of these properties and methods directly.

Facet and *FacetValue* objects also provide many properties. These properties are covered under the appropriate functional categories, and also in the *Facet* and *FacetValue* categories at the end of this quick reference.

CellValue and *Hilite* objects provide a handful of properties, which are covered in the appropriate functional categories only.

For more detail, please refer to the following sections of the online *SmartClient Reference*:

- Client Reference > Components > Grids > CubeGrid
- Client Reference > Components > Grids > CubeGrid > CubeGridFacet
- Client Reference > Components > Grids > CubeGrid > CubeGridFacetValue

CubeGrid APIs may be accessed via JavaScript programming or Isomorphic XML tags. The schema for these APIs are defined in the following files in `isomorphic/system/schema`:

- `CubeGrid.ds.xml`
- `CubeGridCell.ds.xml`
- `CubeGridFacet.ds.xml`
- `CubeGridFacetValue.ds.xml`
- `GridHilite.ds.xml`

Data & Metadata		
data	valueArray	
dataSource	datasourceId	
cellIdProperty	string	"ID"
valueProperty	string	"_value"
facets	facetArray	
<i>facet.</i>		
id	string	
title	string	
values	facetValuesArray

Mouse Events

cellOver	handler	cellRecord
cellOut	handler	cellRecord
cellHover	handler	cellRecord
cellContextClick	handler	cellRecord
facetValueOver	handler	facetValues
facetValueOut	handler	facetValues
facetValueHover	handler	facetValues
facetValueContextClick	handler	facetValues, facetId
facetLabelOver	handler	facetId
facetLabelOut	handler	facetId
facetLabelHover	handler	facetId
facetLabelContextClick	handler	facetId

Inline Editing

canEdit	boolean	false
cellChanged	handler	record, newValue, oldValue, rowNum, colNum
<i>cellValue.</i> canEdit	boolean	
<i>facetValue.</i> canEdit	boolean	

Hover Tips

canHover	boolean	
showHover	boolean	
hoverProperties	object	
cellHoverHTML	callback	cellRecord
facetValueHoverHTML	callback	facetValues
facetLabelHoverHTML	callback	facetId

Context Menus

showCellContextMenu	boolean	
showFacetValueContextMenu	boolean	
showFacetContextMenu	boolean	
contextMenuProperties	properties	

Column Controls		
controlLabels	map	
canCloseColumns	boolean	true
canSortData	boolean	true
canSortFacets	boolean	true
<i>facet.</i>		
canClose	boolean	
canSort	boolean	
<i>facetValue.</i>		
canClose	boolean	
canSort	boolean	
sortedFacetValues	facetValues	
sortedFacetId	facetId	
sortDirection	arrayDirection	Array.ASCENDING
closeFacet	handler	facetId
closeColumn	handler	facetValues
sortByFacetValues	handler	facetValues, sortDirection
sortByFacetId	handler	facetId, sortDirection

Advanced/Internal		
rowHeaderGridMode	boolean	false
innerHeaderControlSize	number	13
innerHeaderReorderHandleWidth	number	7
<i>facetValue.</i>		
getCellValue	callback	viewer, record, rowNum, colNum
<i>facet.</i>		
synchColumnLayout	boolean	true
